Chemical Axial Flow Pumps

Source Pumps & Systems Co., LTD.

www.sourcegroup.com.cn

Instruction

SOW series imposed-circulating pump is designed by GB/T13008-1992 and developed by ourselves referring to the advanced pump product home and abroad according to the features of alkali, salt, citric acid and Na₂So₄ industries. The series of products have been recognized since 1996 when it was brought into the market.

Performance

—Flow Q: up to 30000m³/h
—Pressure P: up to 1.6MPa
—Head H: up to 10m
—Temperature T: up to 180 ℃

Applications

Mainly applied in the imposed circulation of Various of crystable saturated solution in the course of evaporation/concentration in alkali, salt, citric acid and Na2S04manufacture industries.

Features

SOW imposed circulation pump has two kinds structures one is typically applicable for the installation supported by ground. It has axial suction and radial discharge. In order to repair easily, the rotation part s composed by impeller shaft can be drawn from pump casing. The re is no need to disassemble the suction and discharge piping. The other is half-suspending structure applicable for the pump part suspending on the piping and the

motor installed on the ground. In order to reduce the w eight of the part suspending, front-open structure is taken.

The impeller of the imposed circulation pump locate s in the impeller housing which clearance can be adjusted according to impeller's factual location in order to ensure the impeller clearance locate in the optimal location and improve the operation efficiency.

There are two seal structures: double-action stuffing box (operation stuffing seal and shutdown stuffing seal are respectively assembled) and double end cartridge mechanical sea l (which is propitious to seal's assembly& disassembly).

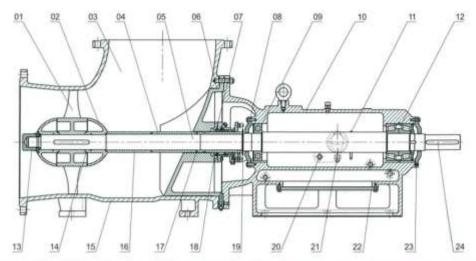

Bearing is lubricated by oil with a cooling device to cool the oil so that the operation environment of the bearing can be changed .

The performance of the pump can be adjusted by changing impeller's emplacement angle and pump speed according to technology requirement to satisfy different evaporation device.

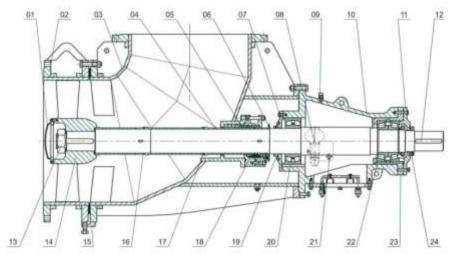

The parts contacting with the fluid are made of 304, 304L, 316, 316L and 804 etc material. 22 types of material can be selected in our plant, which is as per different medium.
